

Counselor NIDS — System Design

Every hop passes through a Redis stream (amber) — services never call each other directly

The spine is the real order data moves: Extractor → Observer → Detectors → verdict. Each arrow is a write to, or a read from, a Redis stream — the two services on either side never talk directly. Snort runs in parallel on the same traffic and reads the ML's verdict to label agreement.

→ write to stream → read from stream Redis stream / key
